NHS Choices
Provides online information and guidance on all aspects of health and healthcare, to help you make choices about your health.
w: www.nhs.uk
The aim of this leaflet is to help answer some of the questions you may have about having a lumbar discectomy. It explains the benefits, risks and alternatives of the procedure, as well as what you can expect when you come to hospital. If you have any questions or concerns, please do not hesitate to speak to a doctor or nurse caring for you.

What is a lumbar discectomy?
Your spine is made of a number of bones called vertebrae. They are connected to one another allowing your spine to move and protecting the spinal cord and nerves. These strong interconnections are made up of intervertebral discs (which act as your spine’s shock absorbing system) and facet joints (which connect the vertebrae to one another). Due to a variety of reasons, you can have a slipped or protruding disc which can be a cause of back pain and/or leg pain (known as sciatica). Sciatica is normally the result of pressure on your spinal nerve root by a slipped disc.

During a lumbar discectomy your doctor removes the prolapsed (slipped) portion of the disc away from your spinal nerve root. Revision discectomy is when you have had a previous discectomy to your spine.

The operation can be done with the aid of a microscope or surgical loupes (small magnifying devices).

Based on your symptoms and the results of MRI and/or CT scans and x-rays, your surgeon will decide exactly which disc needs removing.

Will I have a follow-up appointment?
Yes, six to eight weeks after your surgery. We will send you an appointment letter but if you have not heard from us within four weeks after leaving hospital, please contact us. At this appointment will have an x-ray of your spine, and you will be seen by a physiotherapist or a doctor depending on your pre-operative symptoms.

Contact details
If you have any concerns about your operation, please contact the following (Mon – Fri, 9am – 5pm):

- Mr Lucas’ and Mr Ember’s secretary on 020 7188 4468
- Mr Lam’s, Mr Fakouri’s and Mr Liantis’ secretary on 020 7188 4467

Please contact your GP or attend your local A&E department if you have any urgent medical concerns outside these hours.
If you have been referred to physiotherapy, you should expect to have an appointment four to six weeks after your surgery date. If you are due to have physiotherapy at your local hospital and have not heard from them by this time regarding your appointment, please contact your GP.

If your pain does not settle within four to six weeks, you can either be reviewed in your scheduled outpatient appointment or you can contact your GP for advice and pain management.

What should I do if I have a problem?
Please contact your GP if you experience any of the following:

- excruciating pain unlike your normal symptoms
- increasing redness, swelling or oozing around the operation site
- fever (temperature higher than 38.5°C)
- sudden weakness or numbness which is not resolving
- sudden loss of bowel or bladder control
- severe headache which is not improved with painkillers.

What are the benefits – why should I have a lumbar discectomy?
A lumbar discectomy is used for therapeutic purposes. The main aim of the operation is to relieve your sciatica symptoms although sometimes your back spasms will improve as well. It is not a procedure to improve chronic back pain where the cause has not been established.

After a successful primary discectomy, majority of patients experience 80% reduction of leg pains. This figure varies with a revision procedure – please ask your doctor for details.

What are the risks of a lumbar discectomy?
In general, the risks of a lumbar discectomy relate to the anaesthetic (it will be done when you are asleep under general anaesthetic) and the procedure itself.

For more information about having an anaesthetic please see our leaflet, Having an anaesthetic. If you do not have a copy, please ask us for one. If you are having sedation, you will be able to discuss this with the anaesthetist before surgery and he/she will identify the best method for you.

Lumbar discectomy is commonly performed and is generally a safe procedure. Before recommending the operation, your doctor will have considered that the benefits of the procedure outweigh any disadvantages. However, to make an informed decision and give your consent, you need to be aware of the possible side effects and risks/complications.
Rare complications include:

- **Infection (affects around two out of every 100 patients treated):** this can be serious if the infection gets into your spine or settles in your disc space. If it occurs, you will need an intense course of antibiotics in hospital.

- **Bleeding (affects less than one out of every 100 patients treated):** very rarely this may include damage to the main blood vessels at the front of the spine (the aorta). If you take medicines to thin your blood, there is an increase risk of an epidural haematoma (a localised collection of blood around your spinal nerves). This can cause complications, such as cord compressions which may require a further procedure. You will be advised if you need to stop taking blood-thinning medicines before your operation.

- **CSF leak (affects less than one out of every 100 patients treated):** occasionally the outer covering of your spinal cord (dura) may be torn causing leakage of spinal fluid (CSF). This is not serious but it can cause a dull headache for up to a week and you will need to lie flat for at least three days after the procedure.

- **Spinal nerve injury (affects around one out of every 100 patients treated):** your nerve root or cauda equina (nerves in the lower part of your spine) may be stretched, bruised or damaged as part of the procedure. This can lead to a loss of feeling or muscle weakness, or bladder/bowel dysfunction. Rarely these symptoms can be permanent.

walking, numbness or controlling your bladder/bowel, please tell a member of staff.

The pressure dressing and drain, if you have one, will be removed before you go home.

You will need to arrange for a responsible adult to collect you from hospital, preferably in a car. Travel on public transport is not recommended.

**What do I need to do after I go home?**

It is essential that you continue to take painkillers as advised after your surgery. Your pharmacist and nurse will discuss with you the management of your painkillers before you go home.

The dressing needs to be kept on until your wound is reviewed by your GP’s practice nurse seven days after the procedure. Once this has happened, you can have a bath or shower as normal without the dressing.

Bending and lifting should be avoided for four to six weeks. You can generally get back to light work after two to four weeks (check with your employer), and can do heavier work and sports after two to three months. You are usually safe to drive within four to six weeks provided that you are able to do an emergency stop.

When you leave hospital you may be referred for physiotherapy either at Guy’s or St Thomas’, or at your local hospital. Physiotherapists will teach specific exercises to help tone and control the muscles that stabilise the lower back.
before closing the skin with absorbable sutures (stitches). Local anaesthetic will be applied to the operated area to relieve pain. You will have a pressure dressing on your back.

**Will I feel any pain?**

You should expect to have some tenderness at the operation site which will last up to 72 hours. You may have more back pain initially but this will settle down with time.

The local anaesthetic should keep you relatively pain-free for a while, but it is best to take things easy for the first 24 hours.

You will also be given painkillers when staying in hospital but please let the doctors and nurses know if you are still in pain.

**What happens after the procedure?**

Following the operation you will be taken to the recovery department. This is where you are monitored for the initial post-operative period. You will then be transferred to the day unit or, if you are staying overnight, to an orthopaedic ward.

You can sit up and move around when you feel comfortable and confident, and a physiotherapist makes sure that you are safe to do so. You will also be shown some simple exercises that you can do when you are at home. If you have any concerns about your

- **Recurrence of disc prolapse**: this can happen in around five out of every 100 patients treated in the first year after their operation.
- **Increased leg pain (affects around one out of every 100 patients treated)**: although rare, this can sometimes happen due to scar tissue build-up around your nerves (this is more common with the revision procedures).
- **Further procedure (affects around one out of every 100 patients treated)**: this includes spinal injections, revision discectomy and lumbar fusion.

**Common complications:**

- **Increased back pain (affects less than five out of every 100 patients treated)**: this usually happens in the first six weeks after your procedure. The pain should settle down but it can sometimes become a chronic symptom especially if you have a very worn disc segment.

**Are there any alternatives?**

There are other pain-relieving therapies that can help ease back pain and sciatica such as pain-relieving medicines, spinal injections and TENS (transcutaneous electrical nerve stimulation) machine. Exercise, acupuncture, yoga/pilates and relaxation therapy may also help ease back pain.
How can I prepare for a lumbar discectomy?

Please refer to the following leaflet which will provide information on how to prepare for your operation:

- The surgical admission lounge (SAL) at Guy's Hospital

If you do not have a copy, please ask us for one or see our website at www.guysandstthomas.nhs.uk (type SAL in the search box).

During your pre-assessment, you should tell your nurse about any health conditions you have, such as diabetes or bleeding disorders, and about any medicines that you may be taking, including blood-thinning and over-the-counter medicines. You may be asked to stop taking certain medicines for several days before the procedure.

If you are a woman of child-bearing age, you must tell your nurse if you could be pregnant. If unsure, you will be asked to have a pregnancy test. This is because x-rays are usually used during the procedure. They are safe for adults, but may harm your developing baby. If you are pregnant, your doctor will talk about alternatives to the procedure.

Giving my consent (permission)

We want to involve you in decisions about your care and treatment. If you decide to go ahead, you will be asked to sign a consent form. This states that you agree to have the treatment and you understand what it involves.

You should receive the leaflet, Helping you decide: our consent policy, which gives you more information. If you do not, please ask a member of staff caring for you for a copy.

What happens during the operation?

A lumbar discectomy is done as an overnight stay procedure. It normally takes around 60 to 90 minutes.

On your day of admission you will be seen by a doctor who will mark the site of the surgery and ask you to sign the consent form. The anaesthetist may also review your fitness for surgery and finalise the planned anaesthetic regime. You will then be taken to the operating theatre.

You will lie on your stomach on a special mattress. This position helps to open up the space between the bones in your spine.

Your surgeon will make a small incision (cut) on your skin after the disc requiring surgery has been confirmed. Once the space around your nerve root is identified and protected, a discectomy is carefully performed. After your procedure, your doctor may chose to insert a suction drain (a thin tube attached to a measuring bottle that helps to remove fluids collected after an operation).
