

Femoro-Femoral/Ilio-Femoral cross over bypass graft

The aim of this information sheet is to help answer some of the questions you may have about having a femoro-femoral/ilio-femoral bypass operation. It explains the benefits and risks of the procedure as well as what you can expect when you come to hospital.

If you have any questions or concerns, please do not hesitate to speak to a doctor or nurse caring for you.

What is a femoro-femoral bypass?

The iliac artery supplies blood to your legs. Unfortunately some people develop narrowing or blockages in the iliac arteries. Gradually the leg muscles develop symptoms of pain. The pain is normally worse when exercising but eventually it may become so severe that it occurs at night and may even progress to gangrene. When only one iliac is blocked it is possible to join the femoral artery at the top of your thigh and the femoral artery from the good side (the leg that has the better circulation) using a graft. This means that the blood to the bad leg travels down the iliac artery on the good side, crosses over, under the skin of the lower abdominal wall and then into the artery on the bad side.

What happens during the operation?

You will usually have two cuts, either one in each groin, or, one in the groin and another in the lower part of the tummy. An artificial graft will be inserted to carry blood from the main artery going to your good leg to the main artery in your bad leg, bypassing the blocked artery. The artery going to your good leg will therefore supply both legs with blood. The wounds are often closed with stitches that dissolve by themselves, or with stitches/clips that will need to be removed.

What are the benefits – why should I have a femoro-femoral cross over bypass?

This operation should allow you to walk further and without pain. This surgery is also recommended when the circulation is so poor that your foot is painful at rest or at night.

What are the risks?

- **Bypass blockage** - the main possible complication of this operation is blood clotting within the bypass causing it to block. If this occurs it will usually be necessary to perform another operation to clear the bypass.
- **Graft infection** - very rarely (in about one in 500 people), the artificial graft may become infected. This is a serious complication and usually treatment involves removal of the graft.

As with any major operation there is a risk of you having a medical complication. All potential risks will be explained and discussed with you when the consultant asks you to sign the consent form before the operation.

If you are having the operation under general anaesthetic, you may wish to read our leaflet, **Having an anaesthetic** for more information.

Giving my consent (permission)

We want to involve you in all decisions about your care and treatment. If you decide to go ahead, you will be asked to sign a consent form. This confirms that you agree to have the procedure and understand what it involves. You should receive the leaflet, **Helping you decide: our consent policy**, which gives you more information. If you do not, please ask us for one.

How can I prepare?

We will send you information about how to prepare for your hospital stay with your admission letter. Please read this information carefully.

We will review your regular medicines when you come to hospital for your pre-admission appointment. If you are taking any antiplatelet medicines (such as aspirin or clopidogrel) or any medicines that thin the blood (such as warfarin), then you may need to stop them temporarily before the procedure. If you are taking any medicines for diabetes (for example, metformin) or using insulin, then these may also need to be stopped temporarily or the dose altered near the time of the procedure. You will be given full information on any changes that you need to make to your medicines at the pre-admission clinic – please ask us if you have any questions.

We will ask you to fast for six hours prior to the surgery. Fasting means that you cannot eat or drink anything (except water) for six hours before surgery. We will give you clear instructions when to start fasting. It is important to follow the instructions. If there is food or liquid in your stomach during your operation it could come up to the back of your throat and damage your lungs. Please continue to take your regular medicines with a sip of water before 6am on the morning of the procedure, unless you have been told otherwise.

Will I feel any pain?

Your operation will be done under general anaesthetic (while you are asleep) or epidural. An epidural is a small tube that is placed into your back through which medication is delivered which will numb your legs. The epidural may then be used to control your pain after the operation. The nurses will try and keep you free of pain either using the epidural, or a machine that delivers painkillers through a drip into your vein that you are able to control yourself by pressing a button, or by oral medication. It is likely that you will experience bruising around the area operated on.

What happens after the procedure?

After the operation you will be transferred to the recovery room where you'll be monitored until you are awake enough to be transferred to the ward. You'll be collected by a nurse from Luke or Sarah Swift ward and be taken back there.

You will be given fluids by a drip in one of your veins until you feel well enough to sit up and take fluids and food by mouth. Within the first two days the epidural, drip (which is inserted during the operation to make sure you get enough fluids) and bladder catheter (used to drain the bladder) will be removed.

You will become gradually more mobile until you are fit enough to go home. You can expect to be in hospital for four - five days. It is common for your legs to be swollen after the surgery and this can take a few months to reduce down. It normally goes completely but may occasionally be permanent. You can reduce the swelling by elevating your legs whilst sitting out in the chair. You will be visited by the physiotherapists in hospital after your operation. They will help you with your breathing to prevent you developing a chest infection and help to get you walking again. You will be given aspirin, which thins the blood and will reduce the risk of your bypass blocking. You will usually need to take aspirin forever.

What do I need to do after I go home?

If your stitches or clips are of the type that needs removing, we will arrange for your GP's practice nurse or district nurse to remove them and check your wound after you have gone home. Your dressing will also usually be removed before you leave hospital. If you still need a dressing when you go home we will arrange for a practice nurse at your GP surgery or district nurse to change it regularly. It is fine to have a shower when you go home.

You should be able to gradually resume normal activities as you feel well enough. Avoid heavy lifting and frequent stretching at first.

What can I do to help myself?

Smoking: If you are a smoker the single most important thing you can do to help yourself is to give up smoking. Stopping smoking will also help to protect all of your arteries making it less likely that you will suffer from heart attacks or strokes. Giving up is not easy but there is a smoking cessation service and support groups that can help. Your vascular specialist nurse or GP practice nurse can advise you about these. You can contact the free NHS smoking helpline on 0800 022 4 322 or the Knowledge & Information Centre (KIC) (details below) who will give you details of our support services.

Inactivity: Gentle exercise such as walking and cycling are recommended to help improve your overall level of fitness. Exercise helps your body to produce healthy cholesterol and this helps to protect your arteries against bad cholesterol.

High blood pressure: It is very important that you have your blood pressure checked regularly, at least every six months. If you have been prescribed medications for high blood pressure, you must make sure that you take it according to the instructions given.

Diabetes: If you have diabetes it is important that your blood sugar levels are well controlled.

High blood cholesterol levels (fatty substance in your blood): You should eat a healthy balanced diet and try to reduce any excess weight. It is important to reduce the level of cholesterol in your blood. Your vascular nurse can refer you to a dietician if needed. You may be prescribed medication to help lower your cholesterol level (e.g. a statin) and low-dose aspirin to help prevent blood clots from forming.

Appointments at King's

We have teamed up with King's College Hospital in a partnership known as King's Health Partners Academic Health Sciences Centre. We are working together to give our patients the best possible care, so you might find we invite you for appointments at King's. To make sure everyone you meet always has the most up-to-date information about your health, we may share information about you between the hospitals.

Contact us

If you have any questions or concerns before or after you have left hospital, please contact the **vascular specialist nurses on 07825 503902** (Monday to Friday 8am – 4pm).

You can also contact **Luke ward on 020 7188 3566** or **Sarah Swift ward on 020 7188 8842** (24 hours) and speak to the ward sister or nurse in charge.

The above contacts can put you in touch with the following vascular consultants should you wish to do so: **Miss Rachel Bell, Mr Stephen Black, Mr Michael Dialynas, Mr Tommaso Donati, Mr Bijan Modarai, Mr Morad Sallam, Mr Mark Tyrell, Mr Hany Zayed, Mr Said Abisi, Mr Sanjay Patel, Miss Becky Sandford, Mr Andrew McIrvine.**
