**Introduction**

This guide is for people who are considering having stereotactic ablative radiotherapy for lung cancer. It will give you an overview of what is involved, and answer some of the questions you may have about this treatment.

Your doctor or a member of your team will talk to you in more detail about your treatment, and will be happy to answer any questions that you have. The team consists of radiographers, doctors and nurses who will help and support you throughout your treatment.

Before starting treatment your scans and history will have been discussed in a meeting attended by your oncologist, a surgeon, radiologist and specialist nurse. All treatment options will have been discussed, including stereotactic ablative radiotherapy. This treatment is usually recommended for people who would normally be suitable for an operation, but cannot have one because other medical conditions make it too risky, or because they decide against surgery for personal reasons.

Your lung cancer key worker is ..........................................

Contact number ..........................................................
Once you have consented (agreed) to radiotherapy, you will be referred for a CT planning scan and radiotherapy.

Radiotherapy appointments are booked by the radiotherapy bookings team, t: 020 7188 3160.

You will attend the Cancer Centre at Guy’s for a planning CT scan.

The scan takes about 20 minutes, but the whole appointment takes 1 hour.

Approximately two weeks later, you will attend for your treatment.

Treatment is divided into 3-8 sessions over 5-17 days. This will usually be on alternate days.

Appointments for your radiotherapy take about 30-45 minutes

You will be seen for a follow-up appointment two weeks later.
What is stereotactic ablative radiotherapy?
Radiotherapy is the use of high energy X-rays to treat tumours. It works by damaging the DNA of tumour cells causing them to die or stop growing. Side effects are generally isolated to the area you are having treated.

Stereotactic ablative radiotherapy is a technique that has been developed to deliver radiotherapy more accurately. This allows us to increase the dose of radiation to the tumour, increasing the chance of tumour control, without causing more side effects to healthy tissues.

What are the alternatives?
For most people the alternative to stereotactic ablative radiotherapy will be conventional radiotherapy.

Some patients may be suitable for surgery, and if this applies to you, your surgeon will talk to you about it. At present we cannot say which treatment is more effective, as there has been no direct comparison between stereotactic ablative radiotherapy and surgery.

What are the benefits of stereotactic ablative radiotherapy?
The main benefit of using stereotactic ablative radiotherapy for lung cancer, compared to conventional radiotherapy, is the much shorter overall treatment time.

Most patients will receive 3-5 sessions (also known as fractions) over 5-10 days with stereotactic ablative radiotherapy, but you can have up to eight sessions. This compares to 20 fractions over 26 days with conventional radiotherapy.
There may be an increased chance of long-term tumour control compared to conventional radiotherapy, although a direct comparison has not been made. Please ask your doctor if you would like to discuss this in more detail.

**Are there any other differences?**
Other differences are mainly practical. The individual treatment time for each fraction is approximately 45 minutes with stereotactic ablative radiotherapy, compared with 15 minutes with conventional radiotherapy.

**Before radiotherapy starts**
**Pacemakers**
If you have a pacemaker, please tell your doctor as soon as possible. You will need to have a pacemaker check before your radiotherapy treatment.

**Pregnancy**
All female patients under the age of 60 will be asked to confirm their pregnancy status before the first planning session starts. It is very important that you are not, and do not become, pregnant while undergoing radiotherapy planning and treatment.

If you think you may be pregnant at any time during your course of treatment, please tell your clinical oncologist or radiographer immediately. If necessary, please speak to your GP about contraception methods suitable for use during radiotherapy.
What are the side effects of stereotactic ablative radiotherapy?

In general the risk of side effects from stereotactic ablative radiotherapy is low in comparison to conventional radiotherapy. Not everyone will experience all the side effects that we mention in this guide. Do not feel that the radiotherapy is not working if you do not experience all the side effects, as people react individually.

While we cannot prevent against side effects, we can help you to manage them. Side effects that occur during your radiotherapy are called early (acute) side effects. They usually begin 1-2 weeks after your treatment starts. As your treatment progresses, these become more severe and are usually at their worst 1-2 weeks after your radiotherapy treatment finishes. Then, they gradually start to improve, and by three months after the end of your treatment, most will have resolved or at least improved considerably. Early side effects affect all patients, but the severity varies.

There are also side effects that occur months to years after the treatment has finished. These are called long-term side effects and are consequences of the radiation treatment. You may or may not experience them – not everybody does. They may start during treatment and then gradually become worse after treatment, or they may develop slowly over a long period of time. Some may improve slowly but others may be permanent.

We will support you and help you to manage these side effects, with advice and medications when necessary.
Possible early side effects

Skin reaction
It is common to have a skin reaction from radiotherapy. Any reaction may not happen immediately, it can develop over several treatments. Skin in the treatment area may become dry, red and itchy.

Tiredness
This treatment may make you feel tired. Several things can cause this:
- Your body needs to repair itself, which uses energy.
- Travelling to and from the hospital for appointments.
- The change in daily routine.

Eating difficulties
You may have problems eating due to loss of appetite or because you are feeling unwell. You may also find eating difficult, as your food pipe (oesophagus) might become sore if it is close to the treatment area. Speak to the radiographers who will give you advice or can refer you to a dietician.

Breathlessness and cough
You may find that symptoms such as breathlessness and a productive cough become worse during treatment. These symptoms will gradually settle down after your treatment has finished.

Less common side effects
There is a small risk of inflammation of the lungs. This is unlikely to interfere with your daily activities, but can do so in up to 5 in 100 people. Rib fractures have been reported with this treatment. The risk depends on the area we need to treat and affects up to 4 in 100 people.
Who will look after me during my treatment?

A number of healthcare professionals will be involved in your treatment and care. Below is a list of all of the doctors, nurses, specialists and departments who will look after you while you are having radiotherapy.

Clinical oncologists are doctors who are trained in the use of radiotherapy and chemotherapy. They are supported by a team of specialist registrars, therapeutic radiographers, nurses and administrative staff. The consultant clinical oncologist will be in charge of your care.

Therapy radiographers are specifically trained to plan and deliver the radiotherapy. They provide support and advice on radiotherapy side effects and their management. The radiographers will have day-to-day responsibility for you while you are receiving radiotherapy.

Your clinical nurse specialist (CNS) will provide support and advice on all aspects of your treatment.

Oncology nurses provide support and advice on the side effects of radiotherapy and chemotherapy, and their management. Chemotherapy nurses will be involved in delivering chemotherapy treatment if necessary.

The acute oncology assessment unit will provide emergency medical care for any side effects of treatment or problems relating to the cancer itself. This service is available Monday to Friday, 9am-6pm. Emergency contact details will be provided for out-of-hours problems. Their telephone number is t: 020 7188 3754.
Radiotherapy planning

Radiotherapy planning occurs before you start treatment. The first step is to have a treatment planning CT scan. The scan takes images of your lungs throughout the whole of the breathing cycle. It is known as a four-dimensional (4D) CT scan. The scan is used to outline the exact part of the lung that needs to be treated.

You will be asked to remove your clothes from the waist upwards, and lie on your back on the scanning table, with your arms above your head. The radiographers will take a few minutes to check you are in the correct position. We may need to put some pen marks or metal markers on your skin to help plan your treatment.

You can wash off the pen marks after this visit and the radiographers will remove the metal markers before you leave. A box will also be placed on your chest/abdomen to look at your breathing pattern.

The scan usually takes 20 minutes. After the scan, the radiographers will take some measurements and put small permanent marks on your skin, using ink and a needle. These marks are to show exactly where to position you for your treatment. The radiographers will help you down from the scanning table and you may then get dressed and leave the department.

Your treatment will usually start two weeks after your treatment planning CT scan.
Before you leave, you will be given a provisional list of all your radiotherapy appointments – please bring this list with you to your first treatment appointment. You will be given a confirmed list of appointments on your first day of radiotherapy treatment.

**What is a radiotherapy plan?**
Your radiotherapy plan is the personalised design of your radiotherapy treatment. It is tailor-made for you and is based on the CT scan that you had. A team of doctors, radiographers and physicists will work together to decide where the treatment needs to be directed, avoiding as much healthy tissue as possible.

**Treatment delivery**
The treatment is usually divided into 3-5 fractions over the course of 5-10 days. You will usually have your treatments on alternate days. Some patients may require treatment over a slightly shorter or longer period. If this applies to you, your doctor will explain to you the reason why.

As with conventional radiotherapy, your treatment will be on a linear accelerator. This is a type of machine that produces high-energy X-ray radiation. You will be asked to remove your clothing from the waist up, so that the radiographers can see the permanent marks on your skin.

The radiographers will help you lie on the treatment couch in the same position as when you had your CT scan. They will place a box on your chest/abdomen to monitor your breathing. They will move the treatment machine into position. It will come very close to you but will not touch you. You need to lie still and breathe normally.
You will be alone in the room during treatment, but the radiographers will be watching you at all times on closed circuit television. If you need help, wave your hand and the radiographers will return to the room to give you assistance.

Before treatment starts the machine will move a full circle around you, but will not touch you. The machine uses X-rays to produce a CT scan, which will then be used to check that you are in exactly the right position for treatment and that it will be delivered accurately.

Following this scan, the treatment couch you are lying on may move very slightly to adjust your position. At times you may be re-positioned by the radiographers.
Once you are in the correct position, the treatment will start. The machine will move around you delivering the treatment but will not touch you. At times the radiographers may have to enter the treatment room to adjust the position of the machine or to do another scan to make sure that you are still in the correct position. You must remain still at all times.

The treatment will last for 30-45 minutes from walking into the room to walking out again. There may be some music playing in the background, and you will hear some noises from the machine, but you will not feel anything.

**Will my doctor see me during the treatment?**
Once treatment starts, patients do not routinely see their doctor until their follow-up appointment which is approximately 4-6 weeks following the end of your radiotherapy treatment.

**Managing the side effects of stereotactic lung radiotherapy**

**Itchy inflamed skin**
Radiotherapy commonly causes inflammation, redness and itching, 1-2 weeks after treatment begins and can affect the entire treatment area. To reduce the likelihood of this reaction we suggest the following:

- Washing – It is important to keep the treatment area clean. Shower/bath using lukewarm water and your usual soap or shower gel. Use a soft towel to gently pat the skin dry – do not rub.
• Moisturising – This will help your skin to cope better with the treatment. You may continue to use your usual moisturiser or if you need to buy one, we recommend one without the additive, sodium lauryl sulphate (SLS). During treatment, apply the moisturiser sparingly twice a day or more often if your skin is very itchy.
• Do not scratch your skin as it is very fragile during radiotherapy.
• Hydrocortisone cream 1% – This is a steroid that works by reducing inflammation. It can be prescribed if the itchiness becomes problematic.

Do not use either the moisturiser or hydrocortisone on broken skin. Check your skin daily before applying creams. Dressings will be given to you for broken skin.

**Clothing**
Wear loose comfortable clothing.

**Swimming**
Reduce the number of times you swim in chlorinated water, as this can have a drying effect on the skin. After swimming, shower to remove excess chlorine and discontinue swimming if the skin becomes sore.

**Sun**
The skin in the treatment area will be more sensitive during radiotherapy and should not be exposed to the sun. You should protect the skin in this area for at least one year using a high factor sun block.

**Comfort**
Do not use a hot water bottle on your chest during your course of treatment as it will aggravate your skin.
**Tiredness**
You may feel tired during treatment. The best way to cope is to rest, eat regularly and do a small amount of light exercise (such as walking). Ask your friends and family to help you with daily activities.

**How do I get further supplies of my medicines?**
After being prescribed medicines at the hospital, take the white copy of your prescription to your GP who can continue to prescribe these for you.

Anyone with a cancer diagnosis is entitled to free prescriptions. If you do not already have a medical exemption card, you can get an application form from your GP, the oncology outpatient department, or from Dimbleby Cancer Care. Please ask us if you need any further information.

**What happens when treatment ends?**
**Last week of radiotherapy**
The side effects are likely to worsen during the two weeks after treatment, and then they will start to improve.

On the last day of treatment, you will be given a treatment completion form summarising your treatment. We will also send a copy to your GP.

**Follow-up after treatment**
You will see your oncologist in clinic for your first follow-up appointment about 4-6 weeks following the end of your radiotherapy treatment. This appointment is to check that you are recovering well.
You will usually have a CT scan approximately three months after completing your radiotherapy. You will be given the telephone number and information to make your follow-up appointment on your first day of radiotherapy treatment.

Further appointments will be at three month intervals for the first year and then six month intervals in later years. At each appointment you will have a chest X-ray.

**Commonly asked questions**

**Where can I get advice on financial support during treatment?**
At Guys & St Thomas’ there is a Benefits Advice Service, where an adviser is available for appointments. You can book an appointment by telephoning Dimbleby Cancer Care, **t:** 020 7188 5918.

**When can I go on holiday?**
As long as your skin is protected from sun exposure, you can go on holiday as soon as you feel well enough. You may swim as soon as your skin reaction has healed.

**When can I go back to work?**
Some patients continue to work throughout their radiotherapy treatment, while others feel they need a few weeks break before returning.

If you have had a long break from work, it is advisable to plan a phased return, where you work shorter hours at first.
Additional information
In order to improve treatments and services, audits are regularly carried out in the department. This can involve using patient notes. Any data collected will have all personal and identifiable details removed to ensure patient confidentiality. If this is unacceptable to you, and you would prefer that your notes are not seen, please let your consultants know and your wishes will be respected. This will not affect your treatment in any way.

Clinical trials are undertaken within the department, which you may be eligible to take part in. If necessary and appropriate, your doctor will discuss this with you.

Further information and support
The people taking care of you understand that being diagnosed with cancer is very stressful, and the treatment for it may increase your concerns.

After a diagnosis of lung cancer, you may have specific worries. These might include:
- coping with personal relationships
- talking about your diagnosis
- continuing with social and work activities.

Many people feel unable to cope with what is happening to them and feel anxious or depressed. It can be helpful to know that most people find these feelings ease with time.

The following organisations offer information and advice about dealing with lung cancer.

British Lung Foundation
